

Custom software engagements should begin with structure.

This welcome kit gives the client team a working view of how the engagement will move from requirement understanding to testing, deployment, and handover. It is designed to reduce ambiguity, tighten approvals, and create a better rhythm from day one.

Founder-led delivery

Client-specific systems

Structured testing flow

6 months support

Engagement file

PREPARED FOR

[Client name / company name]

PROJECT REFERENCE

[Software / system name]

PREPARED BY

SrS Logics

ISSUE DATE

24 May 2026

Requirement clarity

Real workflow understanding before development starts.

Testing discipline

Structured review, milestone checks, and sign-off handling.

Deployment readiness

Clean handover with support continuity after launch.

OVERVIEW

A clear start improves delivery quality.

SrS Logics builds software around the way a business actually runs. This packet explains how the delivery will move, what the client side should keep ready, how approvals are managed, and what is typically included by the time the system reaches handover.

01 Engagement model

Founder-led delivery with direct business understanding and software shaped around the client's actual operating process.

02 Timeline window

Most engagements move from requirement gathering to testing within roughly 4 to 6 weeks, depending on complexity and response flow.

03 Support window

Post-handover maintenance and support are generally included for 6 months unless revised in writing for the engagement.

04 Commercial structure

Payments are usually handled in three phases: contract confirmation, API/testing milestone, and final handover.

How the engagement will work.

Delivery approach

Our delivery model is built around business requirements, not generic software assumptions.

- Build scope stays tied to the approved workflow and operating needs.
- Client response time affects delivery speed, especially during review and testing phases.
- The best outcomes happen when process owners remain involved in milestone reviews.

Commercial and support principles

Commercial and support clarity are treated as part of delivery discipline, not as last-stage paperwork.

- Pricing depends on system speed expectations, data flow, and local or cloud infrastructure decisions.
- New items beyond approved scope should be logged separately to avoid confusion and drift.
- Support remains structured after handover so the client team is not left unsupported.

Typical delivery journey.

STAGE	TYPICAL TIMING	WHAT HAPPENS	CLIENT ROLE
01	Week 1	Requirement understanding, operating flow review, scope alignment, and approval of the working plan.	Share workflow, decision makers, and priority outcomes.
02	Week 2	Interface structure, process definition, database planning, and internal build setup.	Confirm fields, process details, and exception cases.
03	Weeks 3-4	Core development, logic implementation, reporting flow, and platform assembly.	Review milestone previews and respond quickly to clarification points.
04	Weeks 4-6	Testing, API validation, issue fixes, deployment preparation, and structured handover.	Participate in testing and prepare final users for go-live.

What should be ready from the client side.

Projects move more smoothly when ownership is clear, operating examples are available early, and approvals are not fragmented across multiple people or channels.

REQUIRED FROM CLIENT SIDE	SUGGESTED OWNER	STATUS
Confirmed project contact and approval authority	Management	[]
Current workflow notes or live operating examples	Operations	[]
Reporting, dashboard, or analysis expectations	Management / finance	[]
Existing data samples, formats, or exports	Client technical/data	[]
Testing users and final sign-off participants	Operations / management	[]

Working note

The fastest projects are the ones where the client side supplies real operating context early and keeps one clear approval path throughout the build.

What closure typically includes.

Typical handover package

- Approved software build aligned to the agreed scope
- Deployment-ready environment and relevant database structure
- Role handling, access logic, and operating instructions where required
- Testing closure notes and final issue summary
- Defined support window after handover

Shared responsibility creates better software.

This welcome kit is meant to create a better working rhythm before development begins. When scope, approvals, testing, and handover are handled clearly from the start, the software becomes more stable, more useful, and more aligned with the way the business actually operates.
